# How the blind audience receive and experience audio descriptions of visual events

Ongoing project: Roger Johansson, Jana Holsanova, Viveka Lyberg-Åhlander

## What?

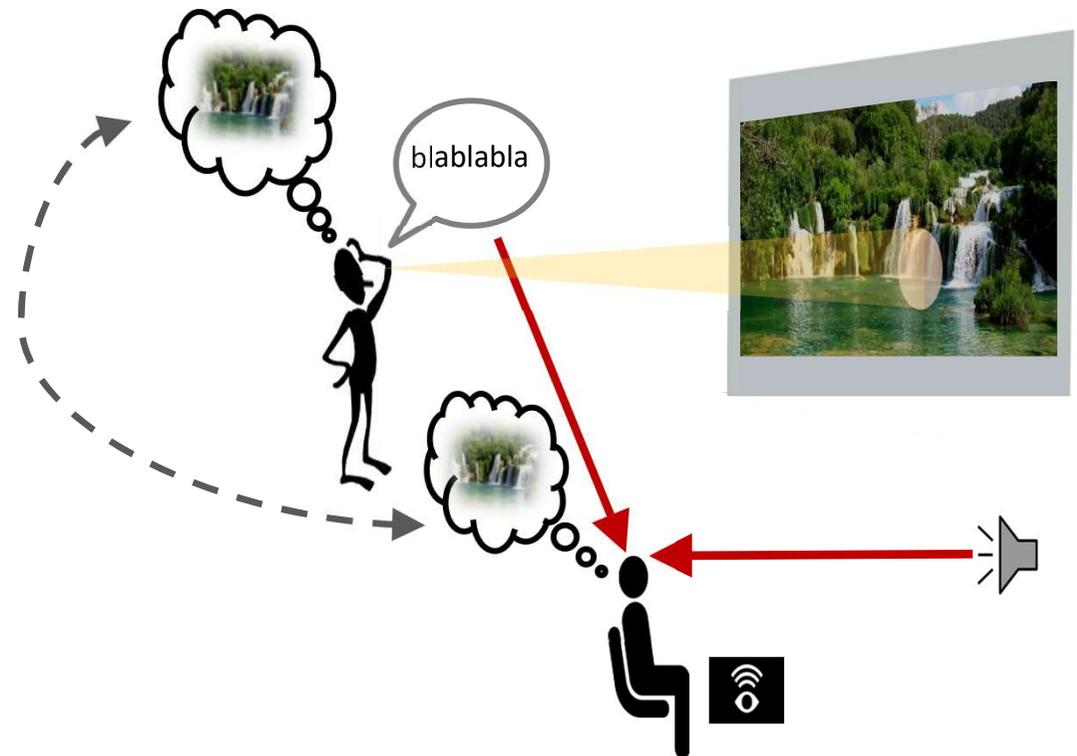

- Identify **perceptual** and **cognitive** factors underlying successful communication between the sighted and the blind during **audio descriptions (AD)** of visual events.

## How?

- Experimental studies using methods from **cognitive science** and **experimental psychology**.

## Why?

- Increase **knowledge** of how these factors affect communication between the sighted and the blind.
- Apply this knowledge to increase the **quality of AD** and **AD practices**, and ultimately facilitate the understanding and **accessibility of visual information** for the visually impaired.

# The present study

- **Aim:** Systematically investigate how non-sighted people experience and understand **spatial relations** and **temporal change** of verbally described events - and to investigate what significance the describer's **voice quality** has in this interaction.
- Specific focus on how sighted vs non-sighted people **imagine** and **create mental models** of spatiotemporal content from verbal event descriptions. Similarities?  
Differences?
- Critical for the **experience** and **understanding** of how described state-of-affairs relate to each other over **time** and **space**.

# The Experiment

- 40 participants
- 20 sighted and 20 non-sighted (congenitally blind or lost sight early in life)
- Groups matched for verbal working memory (Competing Language Processing Task – CLPT)
- Conducted over Zoom
- Each participant listened to 50 event descriptions
- 20 Event descriptions of spatial relations
- 30 Event descriptions of motion changes
- High and Low specificity

# Description Specificity

## Event descriptions of spatial relations

### Low Specificity

On the train. Lisa is in a train compartment. Lisa's sister Maja is also there. Lisa sits **in front of** Maja.

### High Specificity

On the train. Lisa is in a train compartment. Lisa's sister Maja is also there. Lisa sits **opposite** Maja.

# Description Specificity

## Event descriptions of motion changes

### Low Specificity

In school. It's Monday morning. Frank **enters** the classroom door.

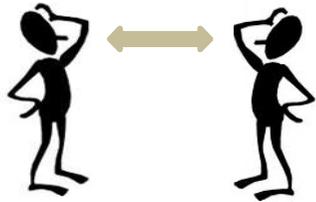

### High Specificity

In school. It's Monday morning. Frank **rushes through** the classroom door.

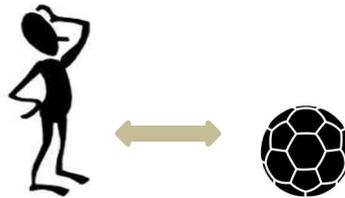

# Types of Event Descriptions

## Event descriptions of spatial relations

1. Person-Person

2. Person-Object

## Event descriptions of motion changes

1. Person

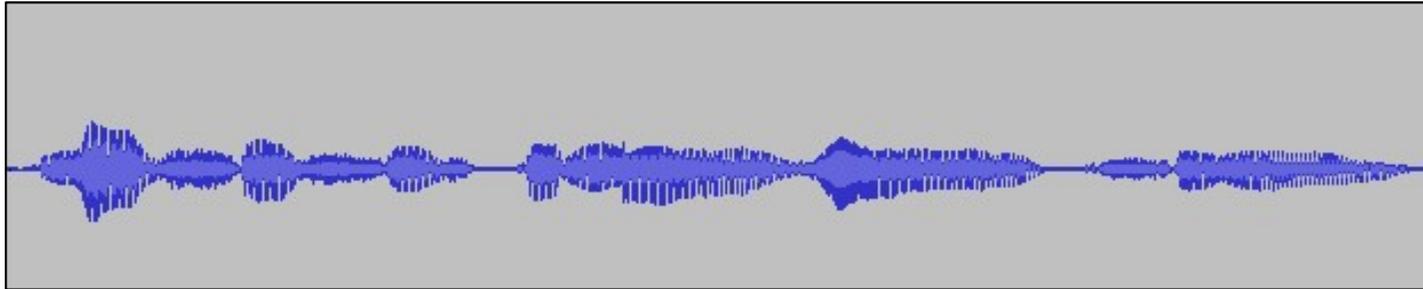

2. Person-Object

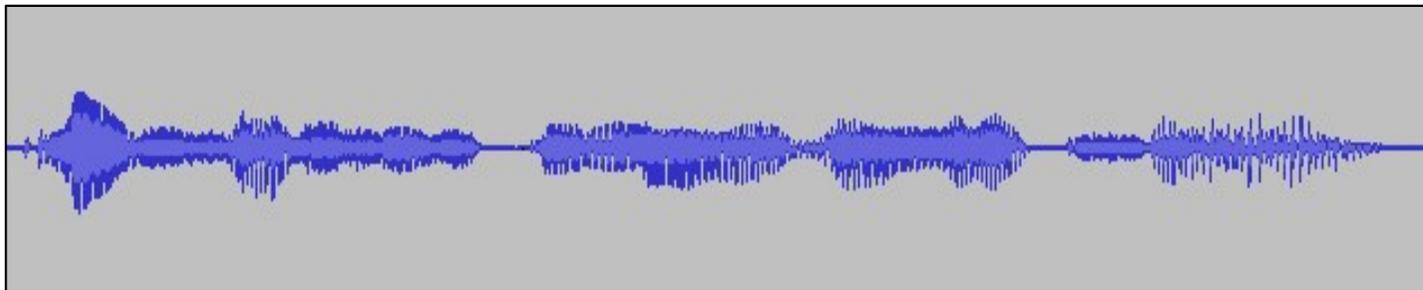

3. Person-Person

# Voice Quality

Normal Voice

Dysphonic (hoarse) Voice

# The Experiment

- Each participant listened to 50 event descriptions
- 20 Event descriptions of spatial relations
  - 10 Person-person, 10 Person-Object
- 30 Event descriptions of motion changes
  - 10 Person, 10 Person-Object, 10 Person-Person
- Equally distributed across high and low specificity
- Equally distributed across normal and dysphonic voice
- Data analysed with Generalised Mixed Effects Models

# The Experiment

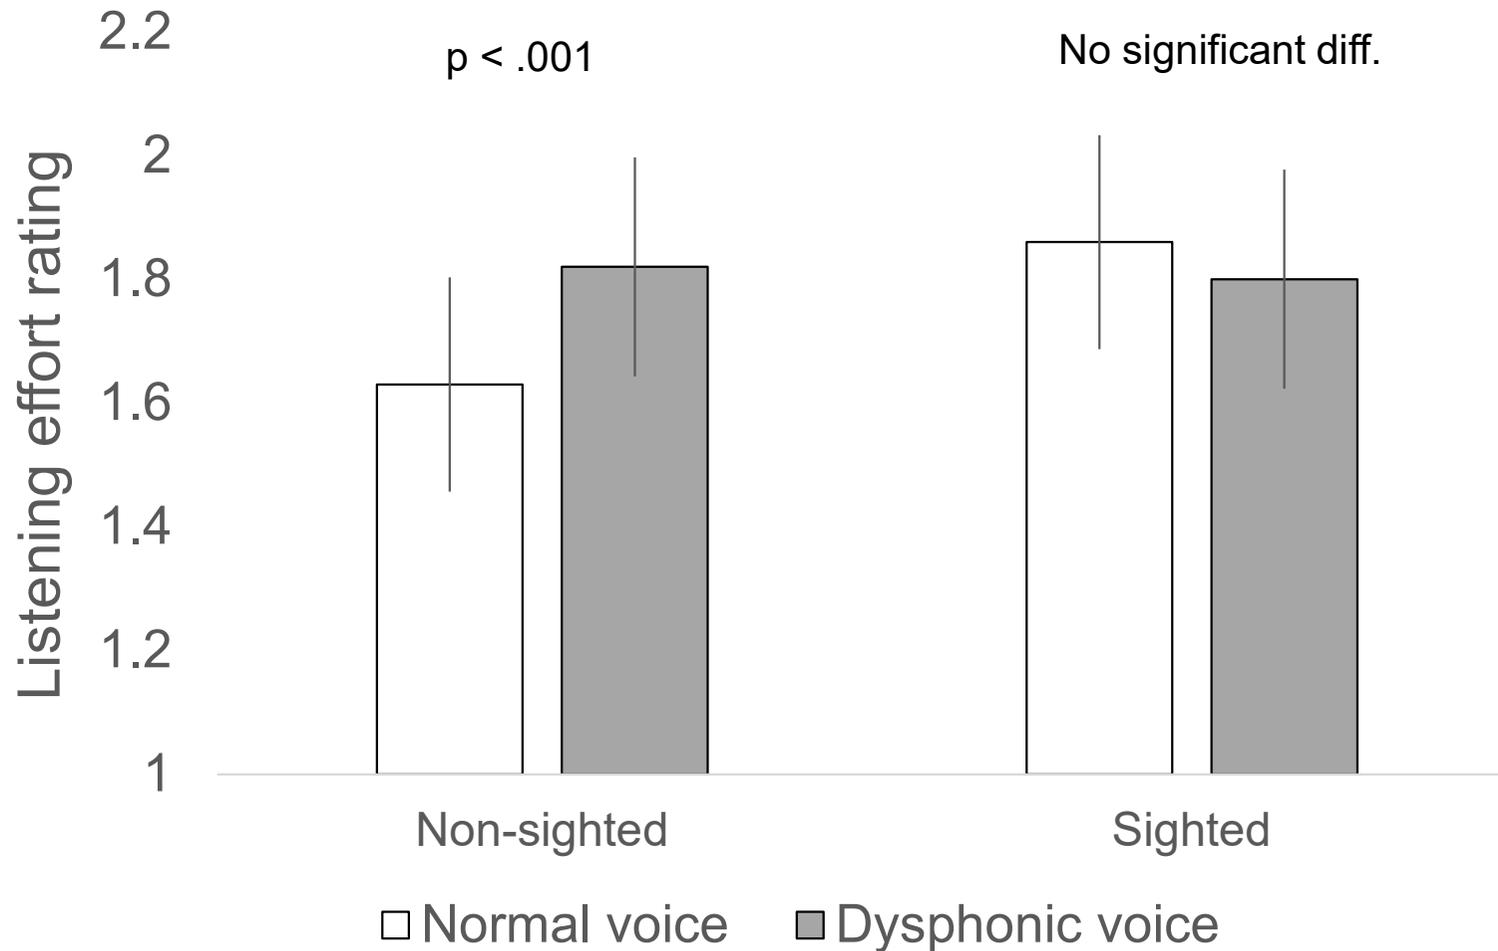

## Task after listening to each event description

On a scale 1 to 6 rate:

1. How well you could **imagine** the content of the described scenario
2. How well you **understood** the described scenario
3. How **effortful** it was for you to listen to the described scenario
4. How **enjoyable** it was for you to listen to the described scenario

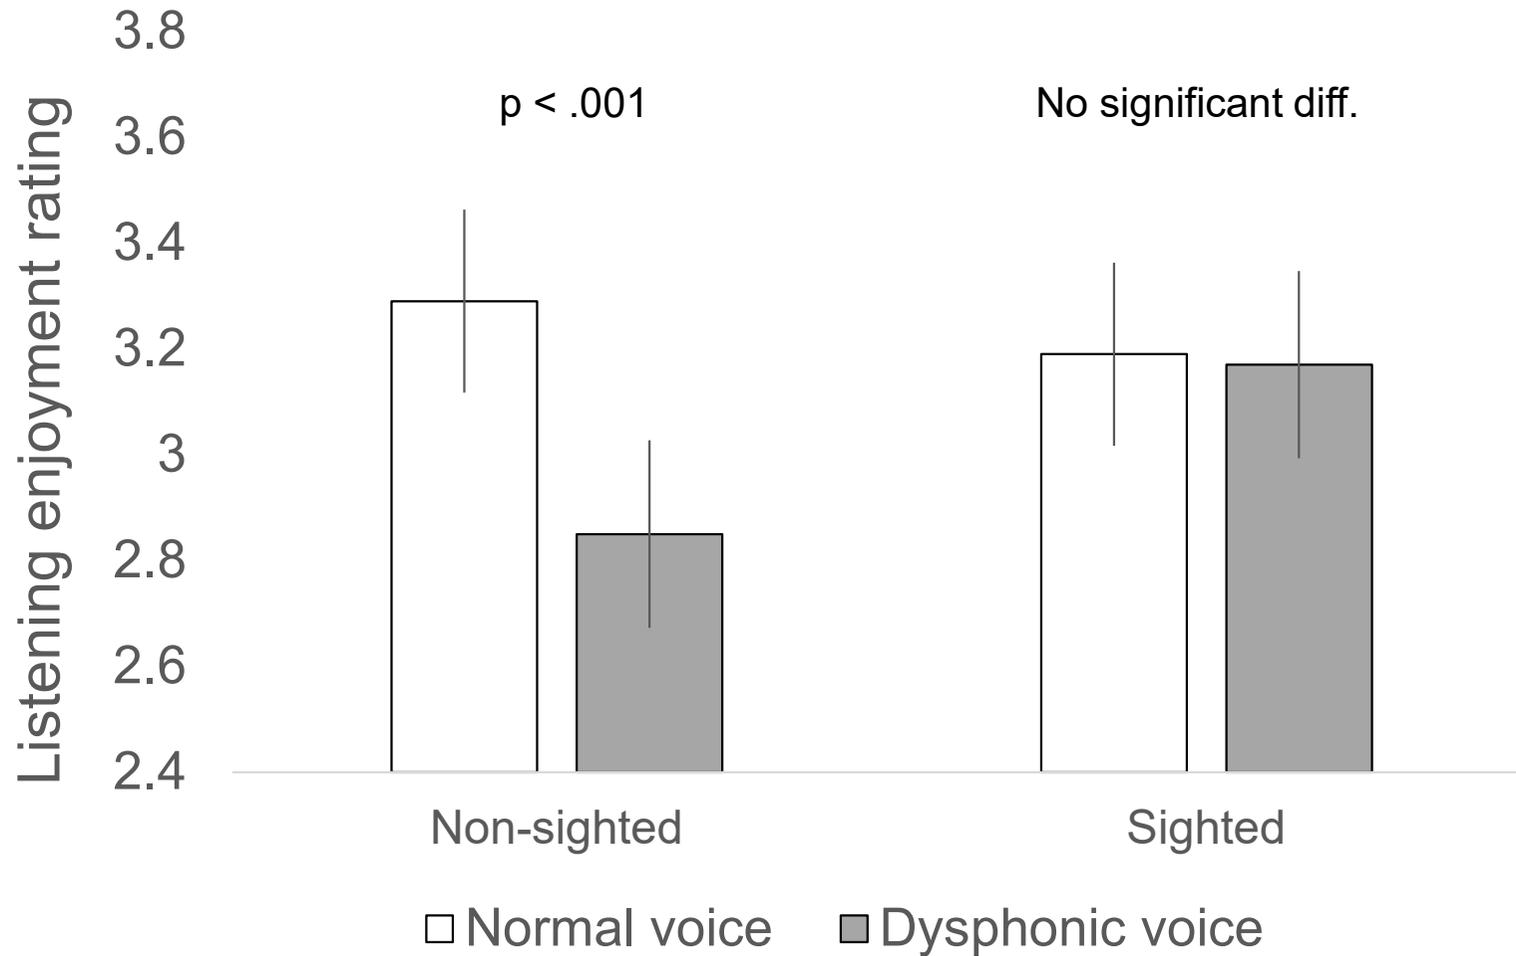

# Results – Voice quality

## Listening effort

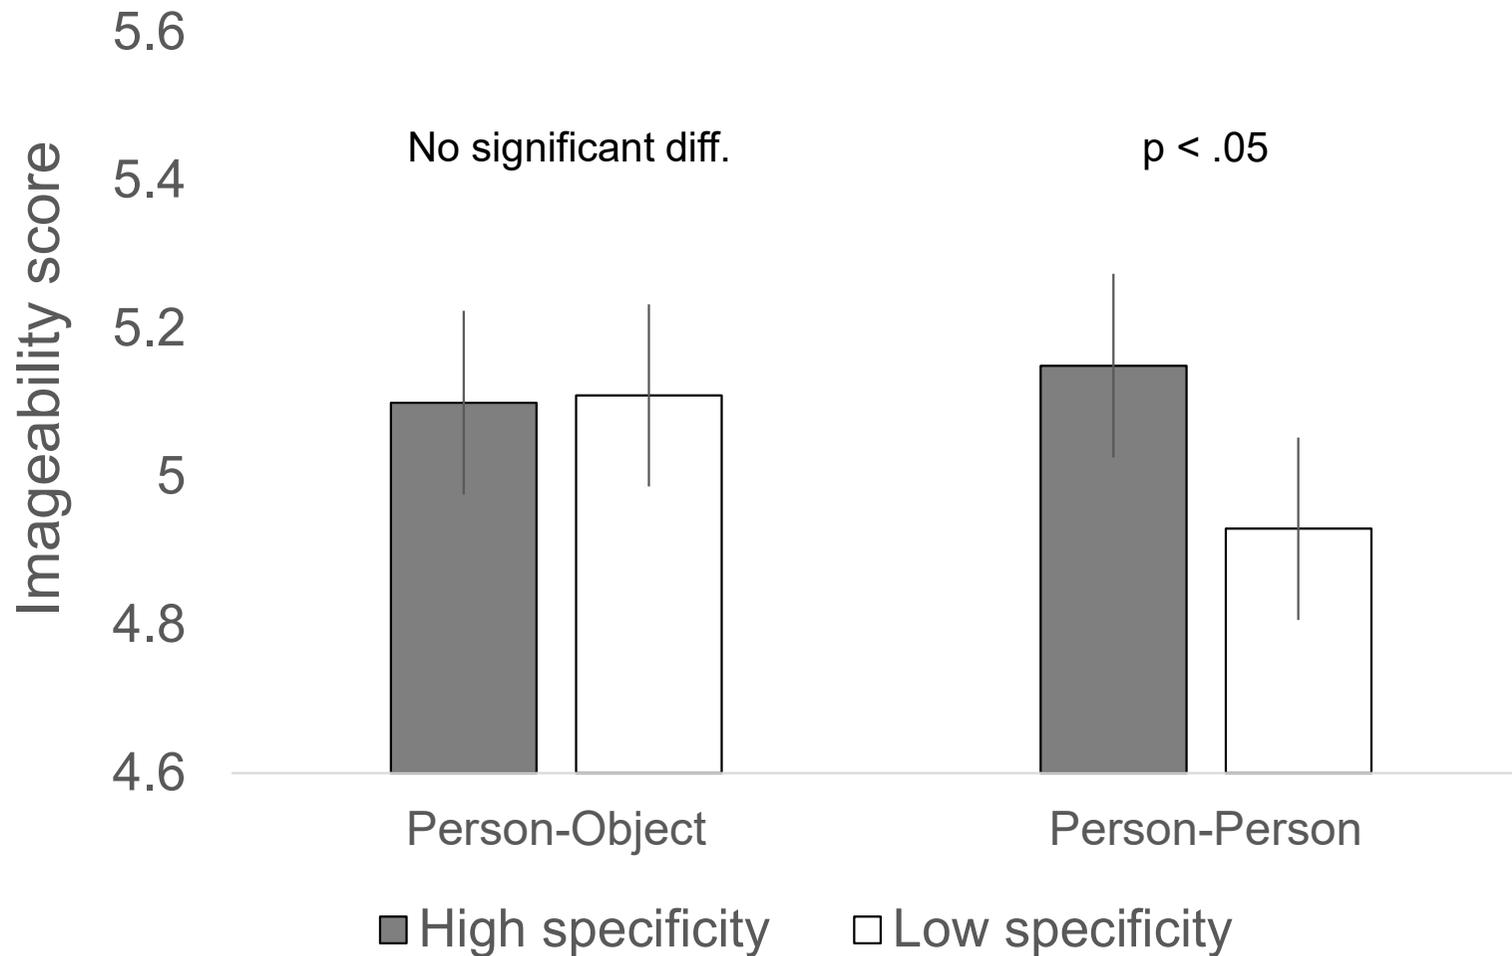

# Results – Voice quality

## Enjoyment

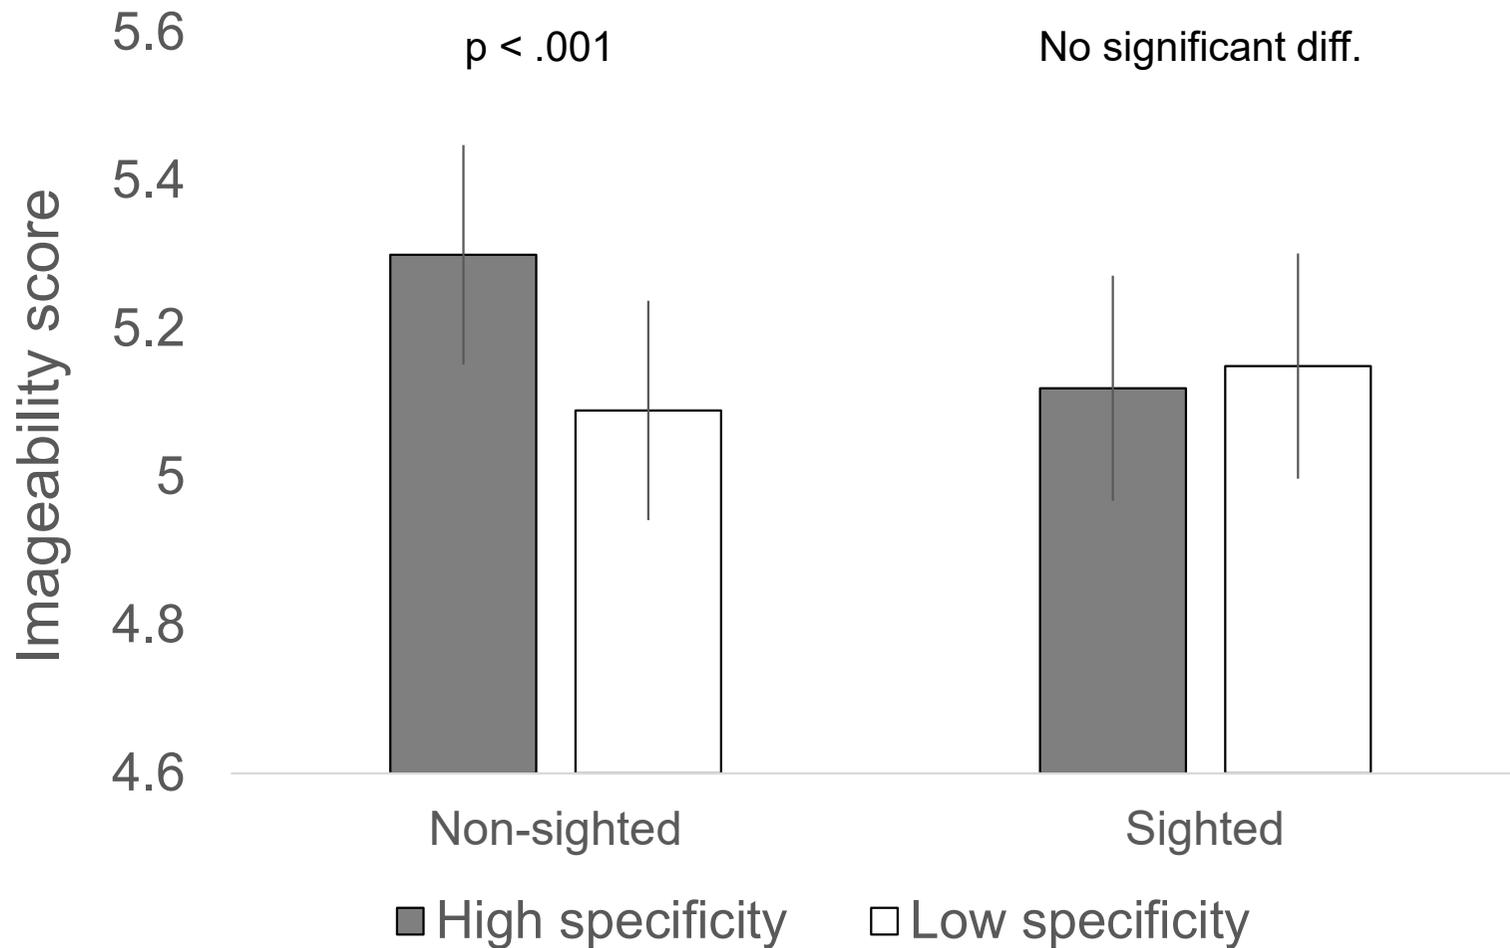

# Results - imageability

## Event descriptions of spatial relations

# Results - imageability

## Event descriptions of motion

# Summary

- **Voice quality** in verbal narration of visual events play a major role in **listening effort** and **enjoyment** of listening.
  - Big difference for sighted and non-sighted listeners!
- **The specificity** in how **spatial relations** and **changes in motion** are described plays a **major role for the imageability** of the described content.
  - Primarily for the non-sighted group and especially prominent for motion changes!
- **Empirical evidence** that these factors are important for successful communication between the sighted and the blind.
- Important factors to consider in **audio descriptions** of visual events.

**Thank you for your  
attention!**
